Fatal error: Call to undefined function mysql_connect() in C:\Inetpub\osticket\setup.

Post #1

I'm trying to install osTicket on a Windows 2003 server, IIS6, PHP 5.0.4, MYSQL 4.1

After filling the setup.php form, I receive the message in the subject.

I'm guessing that PHP isn't able to find some required library in MYSQL, but have no idea what to look for.

The MySQL administrator connects to the server and I created schema called 'osticket' and gave the root user all privs to that schema. root is the user I'm supplying in the database section of the setup.php form.

If you need further info to assist, please ask.

relocate php.ini

Post #2

I had the same problem (PHP 5.0.4, MYSQL 4.1, W2k):
I relocated the php.ini file to %system folder%\php.ini and everything works fine. (The manual suggests the wrong place for the php.ini file - don't choose the \php folder). You can see the setting where PHP searches for your php.ini file by using phpinfo()

Here's a useful web page with a stepbystep help sheet
<http://www.siteinaweek.com/installphp5/howto.php>

 **We got a little further on this. Then. . .**

We ran into this, too. PHP 5.x eliminated native support for MySQL. You have to download a couple of DLLs, activate them in the PHP.ini file (which gets put in the %windir% if you are using Windows and the installer package, and you have to point the "extension_dir" variable to the directory where the dlls are located.

Once we did that, the install script works up to a point, creates most of the tables, then we are getting:

Install Error

1214: The used table type doesn't support FULLTEXT indexes

Install Error

1146: Table 'tickets.ticket_config' doesn't exist

We seem to be moving in the same direction so who has the key to this one?

installing php5 can be a royal pain, especially because of the missing DLL files in the original installer.
 here's a webpage that tells u how to fix it.
<http://www.siteinaweek.com/installphp5/howto.php>
 it provides the missing DLL files too.

Hello everybody!

I've finally got solved the splinter for me!

Here are the steps to get rid of it.

What I did first was reinstalling php by a new way.
 I have zipped version of php-5.0.2-Win32. I created a new folder php on c: disk and put all the

unzipped files into it.

I deleted files I had copied before from C:\windows\system32.

libmysql.dll

libmysqli.dll

php5apache2.dll

php5apache.dll

php5ts.dll

php_mysql.dll

In the Next step I opened a config. file "httpd.conf" for apache
 (i have ver.2.0.52) and added

this content into the bottom of the page.

LoadModule php5_module "c:/php/php5apache2.dll"

AddType application/x-httpd-php .php

PHPIniDir "C:/php"

1-st line indicates where the module needed for apache to load
 php is located

2-nd line indicates the type of php script whether it php or php3
 e.t.c

3-d line indicates where your php.ini file is located (the path

where apache is have to look for
it)

Saved and close it.
Restarted the apache.

After that I went to c:\php, located "php.ini-recommended" file,
made a copy of it and renamed

the original one into php.ini.

Since now my php started to work, but without mysql.

In the next step, I opened php.ini file, found a line
extension_dir = "./" and changed it for

extension_dir = "C:\php\ext" (to find it fast, press ctrl+f on
your keyboard, make sure you have

clicked your mouse at the start of the page, to make it search
from the top.).

Then I found a line ;extension=php_mysql.dll and removed the
semicolon in the begining.

Saved the document.

Restarted the apache.

After all, I ran the test.php file and finally got Mysql info.
If you already got the page opened, don't click go button,
refresh the page.

I believe it will work with you too.

solution for "Call to undefined function mysql_connect()"

Post #7

This is for a Windows 2000 php-5.1.2-Win32, mysql-5.0.18-
win32, apache_2.0.55-win32-x86-no_ssl installation:

I went through all the above steps several times and stumbled
over my solution. While stopping and starting apache a
message box popped up telling me that libmysql.dll was missing
from the ...Apache Group\Apache2\bin\ path. I copied the
missing module to that place and - voila - a working installation.
For some reason the mysql install did not place that dll in that
path.

The apache error log only told me "Unable to load dynamic
library 'C:/Program Files/Apache
Group/Apache2/php/ext/php_mysql.dll". I could see that
message was wrong because that dll was definitely in the path.
At first I was shutting down Apache by rebooting. I saw the
message when I got tired of rebooting.

You are right!!! it worked for me too! thanks man. it was just
that one line: extension_dir = "C:\php\ext" that did it for me. i
had everything else right, Thanks!

fyi: i am using W2003 , IIS , php 5.1.6 , & mysql 4.1.21
