

Troubleshooting for error

Call to undefined function mysql_connect()

while installing PHP5 in windows XP running IIS or Apache

- [Why the error happens](#)
- [Click if you use Windows XP with IIS](#)
- [Click if you use Windows XP with Apache](#)
- [Contact me to report errors with this page](#)

Why the error happens:

PHP4 (and below) has MySQL support included by default; the functions are embedded into the core of PHP. But PHP5 has **removed embedded support** for MySQL and requires MySQL to be loaded as an add-in module, in the same way you have to support anything else. More info can be found the [PHP5 Migration FAQ](#) and the [Database Issues FAQ](#).

If you are using Windows XP with IIS

After downloading and installing the [PHP 5.0.4 installer](#) ...

1. Open the **php.ini** file and make the following changes to its contents (php.ini is a text file and resides in C:\WINNT)

Change this : ;extension=php_mysql.dll to : extension=php_mysql.dll (the semicolon at the start is removed)

Then give the correct path to the extensions directory extension_dir = "C:\Program_Files\php\morephp" <i>(in my case I created a directory called 'morephp' to store all the extensions. If your directory is called 'extensions' the line would be extension_dir = "C:\Program_Files\php\extensions")</i>

-
- 2) Then copy the following files in to the **morephp** directory (as I have mentioned above, **morephp** is a name I gave to a directory into which I dump all the extensions):

php_mysql.dll
php_mysql.dll

The 2 files are available for download [here](#)

And... you should live happily ever after!

Remember to restart IIS before viewing pages.

3) Should you *still* face problems try this. Copy the following files

libmysql.dll
libmysql.dll

in to

c:\windows\system32

The 2 files are available for download [here](#)

4) Still does not work? Try this slightly radical step.

Here is a [dump](#) of all the dll files you would possibly need for PHP5 installation. Simply copy all the files from this directory in to your **morephp** directory.

If your php files simply do not show up on IIS, then check out this [basic tutorial](#) for installing php in IIS, and see what tweaking you need to do in your IIS configuration. The tutorial is of PHP4, but the fundamentals are the same. Here's [still another tutorial](#) for the same.

If you are using Windows XP with Apache

If you are using Apache instead of IIS, copy the following files

php5apache2.dll
php5ts.dll
php_mysql.dll
libmysql.dll
libmysql.dll

in to

c:\windows\system32

The 5 files are available for download [here](#)

Restart Apache before you view the pages.

Here is [another tutorial](#) for installing Php5 in XP and Apache.
