Antennas are devices that convert electrical signals into electromagnetic waves and convert incoming waves back into electrical signals. In a transmitting system, power travels from the transmitter through the transmission line to the antenna, where it is radiated into free space. In a receiving system, the antenna captures electromagnetic waves and sends the signal to the receiver for processing.

Antenna parameters:

- Radiation Pattern — Shows how the antenna spreads energy in different directions
- Gain — Indicates how strongly the antenna focuses signal power
- Impedance — Proper matching improves power transfer and reduces signal loss
- Bandwidth — The frequency range where the antenna performs efficiently
- Polarization — The orientation of the electric field in the radio wave

Antennas are used everywhere in modern wireless systems including Wi-Fi, cell phones, broadcasting, GPS, radar, satellites, and wireless networking.
