

C Programming

[INDEX](#)[◀ Previous](#)[Next ▶](#)

FREE

When the variables are no longer required, the space which was allocated to them by *calloc* should be returned to the system. This is done by,

```
free( date_pointer );
```

Other C calls associated with memory are,

<i>alloc</i>	<i>allocate a block of memory from the heap</i>
<i>malloc</i>	<i>allocate a block of memory, do not zero out</i>
<i>zero</i>	<i>zero a section of memory</i>
<i>blockmove</i>	<i>move bytes from one location to another</i>

Other routines may be included in the particular version of the compiler you may have, ie, for MS-DOS v3.0,

<i>memccpy</i>	<i>copies characters from one buffer to another</i>
<i>memchr</i>	<i>returns a pointer to the 1st occurrence of a designated character searched for</i>
<i>memcmp</i>	<i>compares a specified number of characters</i>
<i>memcpy</i>	<i>copies a specified number of characters</i>
<i>memset</i>	<i>initialise a specified number of bytes with a given chara</i>
<i>movedata</i>	<i>copies characters</i>
