

C Programming

DECLARING VARIABLES TO BE REGISTER BASED

Some routines may be time or space critical. Variables can be defined as being register based by the following declaration,

```
register int index;
```

DECLARING VARIABLES TO BE EXTERNAL

Here variables may exist in separately compiled modules, and to declare that the variable is external,

```
extern int move_number;
```

This means that the data storage for the variable *move_number* resides in another source module, which will be linked with this module to form an executable program. In using a variable across a number of independently compiled modules, space should be allocated in only one module, whilst all other modules use the *extern* directive to access the variable.
