

C Programming

POINTERS TO FUNCTIONS

A pointer can also be declared as pointing to a [function](#). The declaration of such a pointer is done by,

```
int (*func_pointer) ();
```

The parentheses around **func_pointer* are necessary, else the compiler will treat the declaration as a declaration of a function. To assign the address of a function to the pointer, the statement,

```
func_pointer = lookup;
```

where *lookup* is the function name, is sufficient. In the case where no arguments are passed to *lookup*, the call is

```
(*func_pointer) ();
```

The parentheses are needed to avoid an error. If the function *lookup* returned a value, the function call then becomes,

```
i = (*func_pointer) ();
```

If the function accepted arguments, the call then becomes,

```
i = (*func_pointer)( argument1, argument2, argumentn);
```
